

# Final Recommendations & Project Closure

E-Commerce Sales & Customer Analytics — Simulated Portfolio Case Study (2023)

**Purpose:** Summarize the analytical findings, translate them into actionable business recommendations, and demonstrate a structured BA project-closure approach.

## 1. Executive Summary

The analysis is designed to help an e-commerce business improve revenue visibility, customer retention, product performance and return management. The recommended target state combines standardized KPI definitions, automated dashboard reporting, customer segmentation and operational monitoring.

## 2. Key Business Insights

- **Revenue visibility:** A standardized reporting layer reduces ambiguity around revenue, completed orders and average order value.
- **Product performance:** Product and category analysis enables management to identify high-performing products and underperforming areas.
- **Customer behavior:** Separating new and repeat customers supports retention-focused decision making.
- **Returns:** Return-rate analysis by region and category helps identify operational or product-quality patterns.
- **Management reporting:** A Power BI dashboard can provide a consistent management view instead of manually consolidated reports.

## 3. Recommended Actions

| Priority | Recommendation                                 | Expected Business Benefit                         | Owner           |
|----------|------------------------------------------------|---------------------------------------------------|-----------------|
| P1       | Standardize KPI definitions and business rules | Consistent Finance and management reporting       | Finance / BI    |
| P1       | Publish an executive sales dashboard           | Faster performance monitoring and decision making | BI / Sales      |
| P1       | Monitor return rate by category and region     | Earlier identification of operational issues      | Operations      |
| P2       | Create new vs repeat customer reporting        | Improved retention and campaign targeting         | Marketing / CRM |
| P2       | Review top and low-performing products         | Reduce assortment and sales planning              | Product / Sales |
| P3       | Introduce role-based dashboard access          | Improved reporting governance                     | IT / BI         |

## 4. Project Closure Checklist

- Confirm approved requirements and change requests are baselined.
- Confirm traceability from business requirements through UAT.
- Confirm dashboard/report requirements are documented.
- Confirm open defects, risks and pending changes have owners.
- Obtain business/stakeholder acceptance where applicable.
- Archive final BA documentation and version history.
- Capture lessons learned and reusable templates.

## 5. Lessons Learned

- Define KPI formulas early, especially where Finance and Business teams use different interpretations.
- Maintain traceability throughout the project instead of rebuilding it during UAT.
- Validate dashboard requirements with users before development to reduce rework.
- Treat requirement changes through a visible change-control process.
- Use realistic acceptance criteria that can be objectively tested.

## 6. BA Interview Talking Point

“For closure, I would not consider the project complete just because development is finished. I would verify requirement traceability, UAT coverage, approved changes, open risks and stakeholder acceptance. I would then summarize the business recommendations and document lessons learned so the project outputs remain usable after handover.”

**Portfolio note:** This project is simulated and illustrative. The recommendations demonstrate BA analysis and documentation skills and should not be represented as results from a real employer or production system.
