

Change Management & Change Control

E-Commerce Sales & Customer Analytics — Simulated Portfolio Case Study (2023)

Document purpose: Define how changes to approved requirements, scope, KPIs, reporting logic and security controls are evaluated, approved, traced and validated.

1. Change Control Principles

- Every change is logged with a unique Change ID and business rationale.
- Impact is assessed before implementation across scope, requirements, data, reports, UAT, risk and effort.
- Approved changes update the relevant baseline documents and traceability links.
- High-impact or security-related changes require the appropriate business/IT approval before implementation.
- Rejected or pending changes remain visible in the change log; they are not silently removed.

2. Change Control Workflow

Step	Activity	Primary BA Responsibility
1	Raise change	Capture request, reason, requester and date
2	Assess impact	Evaluate scope, requirements, data, report, risk and UAT impact
3	Review options	Clarify alternatives, dependencies, effort and business value
4	Approve / reject	Route to appropriate owner or change authority
5	Update baseline	Update BRD/FRD/business rules/user stories/RTM/UAT as applicable
6	Implement	Coordinate with development, data and BI teams
7	Validate	Ensure UAT scenarios cover the approved change
8	Close	Record outcome, approval and closure evidence

3. Impact Assessment Dimensions

- **Scope:** Does the change add, remove or modify approved scope?
- **Requirements:** Which BRD, FRD, business rules or user stories change?
- **Data:** Are source fields, calculations, transformations or data quality controls affected?
- **Reporting:** Are dashboard visuals, filters, measures or KPI definitions affected?
- **UAT:** Which existing tests need modification and which new tests are required?
- **Risk:** Could the change introduce financial, operational, security or delivery risk?
- **Effort:** What development, testing, documentation and stakeholder effort is required?

4. Example Change Decisions

ID	Decision Rationale
CR-001	Approved because product-level visibility directly supports the sales objective and requires limited structural change.
CR-002	Approved with Finance involvement because changing the revenue definition can affect KPI reconciliation and UAT.
CR-003	Approved because return analysis improves operational insight without changing the core source structure.
CR-004	Approved because customer segmentation supports retention analysis and can be implemented through documented classification

CR-005	Pending because access control is high impact and requires security/IT review before implementation.
--------	--

5. BA Interview Talking Point

“I used a controlled change process rather than treating requirement changes as informal requests. I logged each request, assessed downstream impact, updated traceability and UAT coverage, and routed high-impact changes for the appropriate approval. This helped keep the requirements baseline and testing scope aligned.”

Note: This is a simulated portfolio case study. The change requests and decisions are illustrative and should be presented as a demonstration of BA process capability, not as production project history.
